

Hello everyone. My name is Lucius and today I'm going to talk about space.

How many planets are there in our solar system?

We have 8 planets including Mercury, Venus, Earth, Mars, Jupiter, Saturn, Neptune, and Uranus.

Who went to space first?

The first human in space was Soviet Yuri Gagarin.
He traveled on April 12, 1961.

When did NASA first go to space?

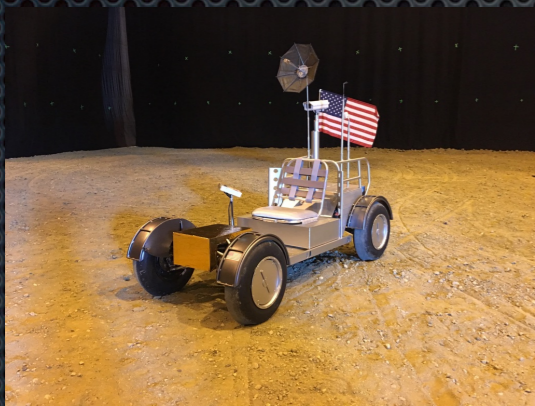

On May 5, 1961
NASA made
their first trip
to the space.
The space
shuttle was
called
Columbia.

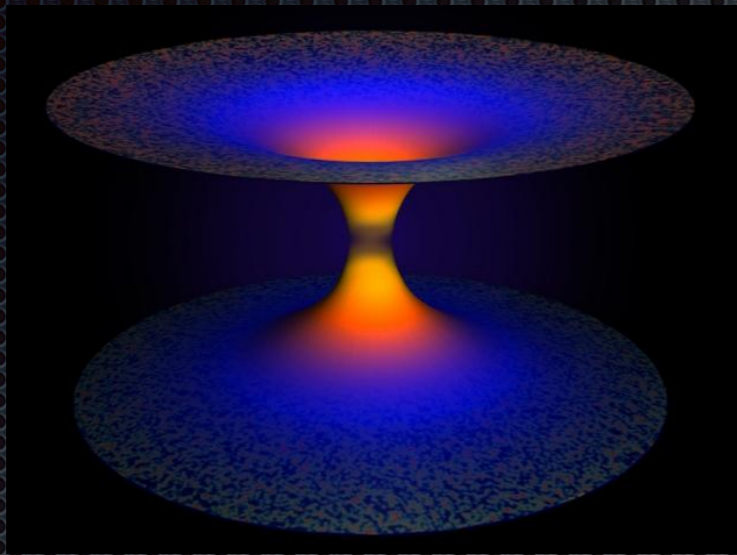

What transportation is used in space

space

They use space ships to transport people and cargo such as food, water, tools and machines into space. They use moon buggies to drive on the moon.

What is a black hole?

A black hole is like a vortex in space. It's like a donut, but it's dangerous so be careful. Why is a black hole dangerous? A black hole is dangerous because it has very strong gravity so if something goes near the black hole, it will be sucked in and destroyed.

What would happen if we destroy earth?

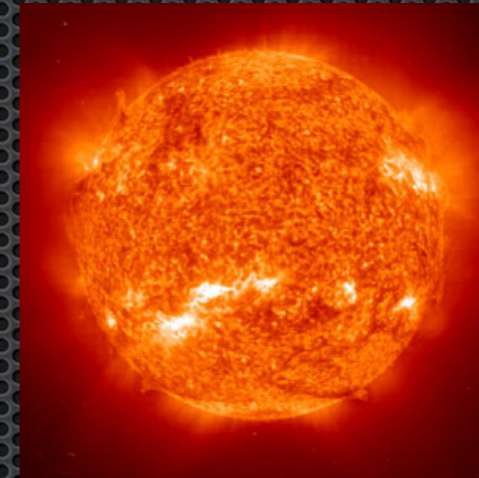

We need to find somewhere else to live. We can not live on the Sun because it's too hot, or Neptune because it's too cold.

Some scientists believe people could live on Mars if we could not live here

anymore

What do we need to live on Mars?

We need sun, water, shelter, plants, and air to live on Mars. Just like Earth!

Thank you for listening. I hope you learned something about space.
